Modelling Potential Malaria Spread in Germany by Use of Climate Change Projections: A Risk Assessment Approach Coupling Epidemiologic and ... (SpringerBriefs in Environmental Science)

Winfried Schröder, Gunther Schmidt

This book investigates the spatial distribution of potential temperature-driven malaria transmissions, using the basic reproduction rate (R_0) to model the reproduction of the malaria pathogen *Plasmodium vivax*. The authors mapped areas at risk of an outbreak of tertian malaria in the federal state of Lower Saxony (pre-study) and for whole Germany (main-study) by means of geostatistics for past (1947-2007) and future periods. Projections based on predicted monthly mean air temperature data derived from the IPCC and regionally discriminated by two regional climate models (REMO, WettReg) for the countrywide study.
