The Technology of Vitamins in Food P. Berry Ottaway

The roleofvitamins inhuman nutrition is an importantaspectofnutrition and food science, and our knowledge in this area is still advancing. Over the last few years there has been a considerable consumer awareness of nutrition and healthy eating which has been enhanced by numerous articles in the media and by nutritional labellingon products. As aconsequence, the food industry has hadtobecomemore concerned with the nutritional valueofproducts and the maintenance of guaranteed micronutrient levels. While the food industry has the responsibility of producing foods that provide a realistic supply of nutrients, including vitamins, it is now also required to offer products with ahigh degree of convenience and long shelflives. Vitamins are a group of chemical compounds which are relatively unstable. They are affected by a number of factors such as heat, light and other food components and also by the processes needed to preserve the food or to convert it into consumer products (e.g. pasteurisation, sterilisation, extrusion, irradiation, etc.). The result of these interactions may be a partial or total loss of the vitamins. Food technology is concerned with both the maintenance of vitamin levels in foods and the restoration of the vitamin content to foods where losses have occurred. In addition, foods designed for special nutritional purposes such as baby and infantfoods and slimming foods need to be enriched or fortified with vitamins and other micronutrients. In addition to being essential nutrients, some vitamins have an important role astechnological additives infoods and can be found acting as colours, antioxidants and texture improvers.
